**HETEROARYL UREA NEUROPEPTIDE Y Y5 RECEPTOR ANTAGONISTS**

*This application claims benefit of US Provisional Application No: 60/257,308  
filed on 12/21/2000.*

This invention relates to heteroaryl urea neuropeptide Y Y5 receptor antagonists useful in the treatment of eating disorders, pharmaceutical compositions containing the compounds, and methods of treatment using the compounds.

Neuropeptide Y (NPY) is a 36 amino acid neuropeptide that is widely distributed in the central and peripheral nervous systems. NPY is a member of the pancreatic polypeptide family that also includes peptide YY and pancreatic polypeptide (Wahlestedt, C., and Reis, D., Ann. Rev. Toxicol., 32, 309, 1993). NPY elicits its physiological effects by activation of at least six receptor subtypes designated Y1, Y2, Y3, Y4, Y5 and Y6 (Gehlert, D., Proc. Soc. Exp. Biol. Med., 218, 7, 1998; Michel, M. et al., Pharmacol. Rev., 50, 143, 1998). Central administration of NPY to animals causes dramatically increased food intake and decreased energy expenditure (Stanley, B. and Leibowitz, S., Proc. Natl. Acad. Sci. USA 82: 3940, 1985; Billington et al., Am J. Physiol., 260, R321, 1991). These effects are believed to be mediated at least in part by activation of the NPY Y5 receptor subtype. The isolation and characterization of the NPY Y5 receptor subtype has been reported (Gerald, C. et al., Nature, 1996, 382, 168; Gerald, C. et al. WO 96/16542). Additionally, it has been reported that activation of the NPY Y5 receptor by administration of the Y5 - selective agonist [D-Trp<sup>32</sup>]NPY to rats stimulates feeding and decreases energy expenditure (Gerald, C. et al., Nature, 1996, 382, 168; Hwa, J. et al., Am. J. Physiol., 277 (46), R1428, 1999). Hence, compounds that block binding of NPY to the NPY Y5 receptor subtype should have utility in the treatment of eating disorders such as obesity, bulimia nervosa, anorexia nervosa, and in the treatment of disorders associated with obesity such as type II diabetes, insulin resistance, hyperlipidemia, and hypertension.

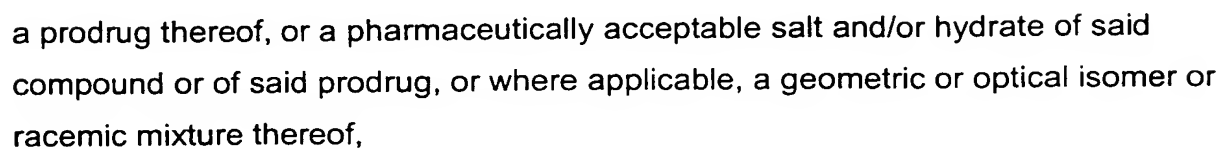

Published PCT patent application WO 00/27845 describes a class of compounds, characterized therein as spiro-indolines, said to be selective neuropeptide Y Y5 receptor antagonists and useful for the treatment of obesity and the complications associated therewith. Known urea derivatives indicated as possessing therapeutic activity are described in U.S. Patent Nos. 4,623,662 (antiatherosclerotic agents) and 4,405,644 (treatment of lipometabolism).

Except where stated otherwise, the following definitions apply throughout the present specification and claims. Additionally, all technical and scientific terms used herein have the same meaning as is commonly understood by one of skill in the art to which this invention belongs. These definitions apply regardless of whether a term is used by itself or in combination with other terms. Hence the definition of "alkyl" applies to "alkyl" as well as to the "alkyl" portions of "alkoxy", etc.

Alkyl represents a straight or branched saturated hydrocarbon chain having the designated number of carbon atoms. Where the number of carbon atoms is not specified, 1 to 6 carbons are intended.

Halo represents fluoro, chloro, bromo or iodo.

5 Aryl refers to a mono- or bicyclic ring system having one or two aromatic rings including, but not limited to, phenyl, naphthyl, tetrahydronaphthyl, indanyl, and the like. The aryl group can be unsubstituted or substituted with one, two, or three substituents independently selected from lower alkyl, halo, cyano, nitro, haloalkyl, hydroxy, alkoxy, carboxy, carboxamide, mercapto, sulfhydryl, amino, alkylamino and dialkylamino.

10 Heteroaryl refers to 5- to 10-membered single or benzofused aromatic rings consisting of 1 to 3 heteroatoms independently selected from the group consisting of -O-, -S-, and -N=, provided that the rings do not possess adjacent oxygen and sulfur atoms. The heteroaryl group can be unsubstituted or substituted with one, two, or three substituents independently selected from lower alkyl, halo, cyano, nitro,  
15 haloalkyl, hydroxy, alkoxy, carboxy, carboxamide, mercapto, sulfhydryl, amino, alkylamino, dialkylamino.

When a variable appears more than once in the structural formula, the identity of each variable appearing more than once may be independently selected from the definition for that variable.

20 N-oxides can form on a tertiary nitrogen present in an R substituent, or on =N- in a heteroaryl ring substituent and are included in the compounds of Formula I.

The expression "prodrug" refers to compounds that are drug precursors which following administration, release the drug *in vivo* via some chemical or physiological process (e.g., a prodrug on being brought to the physiological pH or through enzyme  
25 action is converted to the desired drug form).

The term "chemically stable compound" is defined as a compound that can be isolated, characterized, and tested for biological activity.

For compounds of the invention having at least one asymmetrical carbon atom, all isomers, including diastereomers, enantiomers and rotational isomers are  
30 contemplated as being part of this invention. The invention includes d and l isomers in both pure form and in admixture, including racemic mixtures. Isomers can be prepared using conventional techniques, either by reacting optically enriched or optically pure starting materials or by separating isomers of a compound of Formula I.

Compounds of Formula I can exist in unsolvated and solvated forms, including hydrated forms. In general, the solvated forms, with pharmaceutically acceptable solvents such as water, ethanol and the like, are equivalent to the unsolvated forms for purposes of this invention.

5 A compound of Formula I may form pharmaceutically acceptable salts with organic and inorganic acids. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic, methanesulfonic and other mineral and carboxylic acids well known to those skilled in the art. The salts are prepared by contacting the free  
10 base forms with a sufficient amount of the desired acid to produce a salt in the conventional manner. The free base forms may be regenerated by treating the salt with a suitable dilute aqueous base solution, such as dilute aqueous sodium hydroxide, potassium carbonate, ammonia or sodium bicarbonate. The free base forms differ from their respective salt forms somewhat in certain physical properties,  
15 such as solubility in polar solvents, but the salts are otherwise equivalent to their respective free base forms for purposes of the invention.

In a preferred group of compounds of Formula I, the heterocyclic group attached to Z is

- 10 -

- 5 In particular, the preferred group includes the above compounds wherein R<sup>1</sup> is hydrogen, R<sup>2</sup> is hydrogen or -(C<sub>1</sub>-C<sub>6</sub>)alkyl, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup> and R<sup>7</sup> are independently hydrogen or halogen, R<sup>8</sup> is 1-3 substituents independently selected from the group consisting of H, halogen, -O(C<sub>1</sub>-C<sub>6</sub>)alkyl, -OH, polyhaloalkyl and polyhaloalkoxy, R<sup>9</sup> is -SO<sub>2</sub>(C<sub>1</sub>-C<sub>6</sub>)alkyl, -SO<sub>2</sub>(C<sub>3</sub>-C<sub>7</sub>)cycloalkyl, -SO<sub>2</sub>(C<sub>1</sub>-C<sub>6</sub>)alkyl(C<sub>3</sub>-C<sub>7</sub>)cycloalkyl, -SO<sub>2</sub>aryl, -

- (C<sub>1</sub>-C<sub>6</sub>)alkyl, the sum of j and k is 2 or 3 and the sum of l and m is 2 or 3.

15

Another aspect of this invention is a method of treating a patient having a disease or condition mediated by NPY by administering a therapeutically effective

amount of a compound of Formula I, a prodrug thereof, or a pharmaceutically acceptable salt of said compound or of said prodrug to the mammal. It is preferred that the receptor is the NPY-5 receptor.

Scheme 1

- 5 In Scheme 1, a nitro heteroaryl halide is coupled to an aryl boronic acid to give a nitro-substituted biaryl derivative. Reduction of the nitro group gives a biaryl amine derivative. Alternatively, an amino heteroaryl halide derivative is coupled to an aryl boronic acid derivative to directly give an amino biaryl derivative. Treatment of the
- 10 chloroformate, triphosgene, or N,N'-disuccinimidyl carbonate and an organic base, followed by an amino substituted cyclic amine derivative with the ring nitrogen protected, gives a urea derivative (path A). Cleavage of the protecting group provides an amine that can be derivatized by treatment with, for example, acyl chlorides,

sulfonyl chlorides, and isocyanates. Alternatively, in the urea-forming step an amino substituted cyclic amine derivative wherein the ring nitrogen is derivatized with an  $R^9$  substituent can be used (path B). Path B is the preferred method when  $R^9$  is aryl or

heteroaryl. Compounds of Formula I where  is

Scheme 2

10 In Scheme 2, a biaryl amine derivative is treated with triphosgene and a base followed by treatment with 4-(methylamino)cyclohexanone ethylene ketal to give a urea derivative. Deprotection of the ketal, for example, by treatment with a strong acid, gives a ketone derivative. The ketone can then be derivatized by treatment with

15  $QNH_2$ .

Scheme 3

In Scheme 3, an acid chloride is condensed with thiosemicarbazide to give an N-acyl thiosemicarbazide derivative. Treatment of the N-acyl thiosemicarbazide with a strong acid results in the formation of an aminothiadiaazole derivative. The aminothiadiaazole is converted to a substituted urea derivative as described earlier.

Scheme 4

In Scheme 4 an alpha bromo acetal is condensed with thiourea to form a 5-substituted 2-aminothiazole derivative. The 2-aminothiazole derivative is converted to a substituted urea derivative as described in earlier schemes.

Scheme 5

In Scheme 5, a 5-halo-2-nitrothiazole derivative is coupled to an arylzinc halide under palladium catalysis to give a 2-aryl-5-nitrothiazole derivative. The 5-nitrothiazole derivative is then converted to a substituted urea derivative as described in earlier Schemes.

The compounds of Formula I exhibit selective neuropeptide Y Y5 receptor antagonizing activity, which has been correlated with pharmaceutical activity for treating eating disorders, such as obesity and hyperphagia, and diabetes.

The compounds of Formula I display pharmacological activity in test procedures designed to demonstrate neuropeptide Y Y5 receptor antagonist activity. The compounds are non-toxic at pharmaceutically therapeutic doses. Following are descriptions of the test procedures.

#### cAMP Assay

HEK-293 cells expressing the Y5 receptor subtype were maintained in Dulbecco's modified Eagles' media (Gico-BRL) supplemented with 10% FCS (ICN), 1% penicillin-streptomycin and 200  $\mu$ g/ml Geneticin® (GibcoBRL #11811-031) under a humidified 5% CO<sub>2</sub> atmosphere. Two days prior to assay, cells were released from T-175 tissue culture flasks using cell dissociation solution (1X; non-enzymatic [Sigma #C-5914]) and seeded into 96-well, flat-bottom tissue culture plates at a density of 15,000 to 20,000 cells per well. After approximately 48 hours, the cell monolayers were rinsed with Hank's balanced salt solution (HBSS) then preincubated with approximately 150  $\mu$ l/well of assay buffer (HBSS supplemented with 4 mM MgCl<sub>2</sub>, 10 mM HEPES, 0.2% BSA [HH]) containing 1 mM 3-isobutyl-1-methylxanthine ([IBMX])

Sigma #1-587) with or without the antagonist compound of interest at 37°C. After 20 minutes the 1 mM IBMX-HH assay buffer ( $\pm$  antagonist compound) was removed and replaced with assay buffer containing 1.5  $\mu$ M (CHO cells) or 5  $\mu$ M (HEK-293 cells) forskolin (Sigma #F-6886) and various concentrations of NPY in the presence or  
5 absence of one concentration of the antagonist compound of interest. At the end of 10 minutes, the media were removed and the cell monolayers treated with 75  $\mu$ l ethanol. The tissue culture plates were agitated on a platform shaker for 15 minutes, after which the plates were transferred to a warm bath in order to evaporate the ethanol. Upon bringing all wells to dryness, the cell residues were resolubilized with  
10 250  $\mu$ l FlashPlate® assay buffer. The amount of cAMP in each well was quantified using the [ $^{125}$ I]-cAMP FlashPlate® kit (NEN #SMP-001) and according to the protocol provided by the manufacturer. Data were expressed as either pmol cAMP/ml or as percent of control. All data points were determined in triplicate and EC<sub>50</sub>'s (nM) were calculated using a nonlinear (sigmoidal) regression equation (GraphPad Prism™).

15 The K<sub>B</sub> of the antagonist compound was estimated using the following formula:

$$K_B = [B] / (1 - \{[A'] / [A]\})$$

where [A] is the EC<sub>50</sub> of the agonist (NPY) in the absence of antagonist,

[A'] is the EC<sub>50</sub> of the agonist (NPY) in the presence of antagonist,

and [B] is the concentration of the antagonist.

#### 20 NPY Receptor Binding Assay

Human NPY Y5 receptors were expressed in CHO cells. Binding assays were performed in 50 mM HEPES, pH 7.2, 2.5 mM CaCl<sub>2</sub>, 1 mM MgCl<sub>2</sub> and 0.1% BSA containing 5-10  $\mu$ g of membrane protein and 0.1 nM  $^{125}$ I-peptide YY in a total volume  
25 of 200  $\mu$ l. Non-specific binding was determined in the presence of 1  $\mu$ M NPY. The reaction mixtures were incubated for 90 minutes at room temperature then filtered through Millipore MAFC glass fiber filter plates which had been pre-soaked in 0.5% polyethyleneimine. The filters were washed with phosphate-buffered saline, and radioactivity was measured in a Packard TopCount scintillation counter.

30 For the compounds of this invention, a range of neuropeptide Y5 receptor binding activity of from about 0.3nM to about 1000nM was observed. Compounds of this invention preferably have a binding activity in the range of from about 0.3nM to

about 500nM, more preferably from about 0.3nM to about 100nM, and most preferably from about 0.3nM to about 10nM.

The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily  
20 suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group  
25 consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium  
30 carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by

known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the technique described in the U.S. Pat. Nos. 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for controlled release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredients is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or a soft gelatin capsules where in the active ingredient is mixed with water or an oil medium, for example peanut oil, liquid paraffin or olive oil.

Aqueous suspensions contain the active material in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example, sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethyl-cellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example, lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example, heptadecaethylene-oxyctanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example, polyethylene sorbitan monooleate. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

Compounds of the invention may also be administered in the form of suppositories for rectal administration of the drug. The compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

The compounds for the present invention can be administered in the intranasal form via topical use of suitable intranasal vehicles, or via transdermal routes, using those forms of transdermal skin patches well known to those of ordinary skill in the art. To be administered in the form of a transdermal delivery system, the dosage administration will, of course, be continuous rather than intermittent throughout the dosage regimen. Compounds of the present invention may also be delivered as a suppository employing bases such as cocoa butter, glycerinated gelatin, hydrogenated vegetable oils, mixtures of polyethylene glycols of various molecular weights and fatty acid esters of polyethylene glycol.

The dosage regimen utilizing the compounds of the present invention is selected in accordance with a variety of factors including type, species, weight, sex and medical condition of the patient; the severity of the condition to be treated; the route of administration; the renal and hepatic function of the patient; and the particular compound thereof employed. A physician or veterinarian of ordinary skill can readily determine and prescribe the effective amount of the drug required to prevent, counter, arrest or reverse the progress of the condition. Optimal precision in achieving concentration of drug within the range that yields efficacy without toxicity requires a regimen based on the kinetics of the drug's availability to target sites. This involves a consideration of the distribution, equilibrium, and elimination of a drug. Preferably, doses of the compound of structural The invention useful in the method of the present invention range from 0.01 to 1000 mg per adult human per day. Most preferably, dosages range from 0.1 to 500 mg/day. For oral administration, the compositions are preferably provided in the form of tablets containing 0.01 to 1000 milligrams of the active ingredient, particularly 0.01, 0.05, 0.1, 0.5, 1.0, 2.5, 5.0, 10.0, 15.0, 25.0, 50.0, 100 and 500 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. An effective amount of the drug is ordinarily supplied at a dosage level of from about 0.0002 mg/kg to about 50 mg/kg of body weight per day. The range is more particularly from about 0.001 mg/kg to 1 mg/kg of body weight per day.

Advantageously, the active agent of the present invention may be administered in a single daily dose, or the total daily dosage may be administered in dividend doses of two, three or four time daily.

The amount of active ingredient that may be combined with the carrier materials to produce single dosage form will vary depending upon the host treated and the particular mode of administration.

It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the age, body weight, general health, sex, diet, time of administration, route or administration, rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

### Example 5

### Step 1

A solution of 2-hydroxy-5-nitropyridine (11.2 g, 79.9 mmol) in conc. HCl (57 ml) was warmed to 50 °C and KClO<sub>3</sub> (3.4 g, 27.7 mmol) in water (50 ml) was added dropwise at such a rate that the temperature was kept below 60 °C. During the addition the product began to separate. After TLC monitoring indicated complete consumption of starting material the mixture was cooled to 0 °C and the product was isolated by vacuum filtration. The solid was washed with water and dried at 50 °C under vacuum to give the product (12.3g, 88%) as a solid. <sup>1</sup>HNMR (DMSO-d<sub>6</sub>) δ 8.68 (d, J = 3.2 Hz, 1H), 8.40 (d, J = 3.2 Hz, 1H). MS m/e 175 (M+H)<sup>+</sup>.

### Step 2

To phosphoryl chloride (10.5 g, 68.7 mmol) was added successively, with cooling at 5 °C, quinoline (4.4 g, 34.1 mmol) and the product of Step 1 (12.0 g, 68.7 mmol). The resultant mixture was heated for 2 hr at 120 °C under N<sub>2</sub>. After the reaction was complete as indicated by TLC monitoring, the reaction mixture was allowed to cool to 100 °C, and water (26 ml) was added. The solution was then cooled in an ice bath and the product was isolated by vacuum filtration. The solid was washed with water and dried at 40 °C under vacuum to give the product (12.5g, 94%). <sup>1</sup>HNMR (DMSO-d<sub>6</sub>) δ 9.19 (d, J = 2.4 Hz, 1H), 8.97 (d, J = 2.4 Hz, 1H).

### Step 3

5-3

A flask charged with 3-fluorophenylboronic acid (1.63 g, 11.65 mmol), the product of Step 2 (1.50g, 7.77mmol), ethylene glycol dimethyl ether (18 ml) and potassium phosphate (4.95 g, 23.3 mmol) was purged with N<sub>2</sub>. PdCl<sub>2</sub>(dppf)<sub>2</sub>·CH<sub>2</sub>Cl<sub>2</sub> (0.26 g, 0.32 mmol) was added. The reaction mixture was heated at 80°C under N<sub>2</sub> for 2 hr, allowed to cool, and filtered through celite. The filtrate was extracted with EtOAc (60 ml) was then washed with saturated sodium carbonate (40ml), water (40ml), brine (30 ml), dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated. The residue was subjected to flash chromatography (1:5 CH<sub>2</sub>Cl<sub>2</sub>/hexane) to give the product (1.96g, 100%). <sup>1</sup>HNMR (CDCl<sub>3</sub>) δ 9.39 (d, J = 2.4 Hz, 1H), 8.62 (d, J = 2.4 Hz, 1H), 7.62 (m, 1H), 7.54 (m, 2H), 7.22 (m, 1H). MS m/e 253 (M+H)<sup>+</sup>.

#### Step 4

5-4

To an ice-cold solution of the product of Step 3 (2.25 g, 8.9 mmol) and nickel chloride hexahydrate (4.23 g, 17.8 mmol) in MeOH (100 ml) was added sodium borohydride (1.11 g, 29.5 mmol) in portions. The resulting mixture was stirred at 0-5 °C for 30 min., water (5ml) was added and the whole was concentrated. The residue was treated with EtOAc (100ml) and filtered through celite. The filtrate was dried (MgSO<sub>4</sub>), filtered and concentrated to give the product (2.3 g). <sup>1</sup>HNMR (CDCl<sub>3</sub>) δ 7.53 (s, 1H), 6.97 (m, 1H), 6.84 (m, 2H), 6.63 (s, 1H), 6.53 (m, 1H), 3.90 (s, b, 2H).

#### Step 5

5-5

To a solution of the product of Step 4 (500 mg, 2.25 mmol) in anhydrous pyridine (6 ml) was added phenyl chloroformate (390 mg, 2.49 mmol) dropwise. The reaction mixture was stirred for 16 hr then evaporated *in vacuo*. The residue was taken up in chloroform (10 ml), and Et<sub>3</sub>N (1 ml) and Preparation 1 (722 mg, 3.37 mmol) was added. The mixture was heated at 65 °C for 3 hr. The residue was allowed to cool, diluted with CH<sub>2</sub>Cl<sub>2</sub> (50 ml) and washed with sat'd NaHCO<sub>3</sub> (30 ml), water (30 ml), and NaCl (30 ml). The organic layer was dried (MgSO<sub>4</sub>), filtered and evaporated. The residue was subjected to flash chromatography (2:98 CH<sub>3</sub>OH/CH<sub>2</sub>Cl<sub>2</sub>) to give the product (530 mg, 51%). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 8.41 (d, J = 2.4 Hz, 1H), 8.28 (d, J = 2.4 Hz, 1H), 7.50 (m, 1H), 7.42 (m, 2H), 7.10 (m, 1H), 6.61 (s, 1H), 4.41 (m, 1H), 4.22 (m, 2H), 2.92 (s, 3H), 2.80 (m, 2H), 1.70-1.57 (m, 4H), 1.45 (s, 9H).

The reaction mixture was stirred for 16 hr, then poured into water (100 ml). The whole was extracted with  $\text{CH}_2\text{Cl}_2$  (3x200 ml), dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and evaporated. The residue was subjected to flash chromatography (gradient 1:100 – 5:95 MeOH/ $\text{CH}_2\text{Cl}_2$ ) to give the product (1.71 g, 78%).  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  9.44 (d,  $J = 1.2$  Hz, 1H), 8.55 (d,  $J = 1.6$  Hz, 1H), 7.51 (m, 2H), 7.23 (s, 1H), 6.84 (m, 1H), 4.79 (m, 1H), 4.53 (m, 1H), 3.91 (m, 1H), 3.20 (m, 1H), 2.94 (s, 3H), 2.63 (m, 1H), 2.12 (s, 3H), 1.86-1.55 (m, 4H).
